H. TTL Signal Timing Diagram

- **CPD**

When IB is set to high, CPD is asserted low after 11 ± 1 (19 ± 1) flux reversals. When IB is set to low, CPD is asserted low after 13 ± 1 (27 ± 1) flux reversals. CPD returns to high level about 35ms after the last RCP*.

- **RCP***

The RCP* signal indicates RDD*'s output is valid.

- **RDD***

The data signal is valid when the RCP* is low. If the RDD* signal is high, the bit is zero (0); otherwise, the bit is one (1).

NOTE :

1. Ignore start bits selectable
 - L: 13 ± 1 or H: 11 ± 1 flux changes for track B.
 - L: 27 ± 1 or H: 19 ± 1 flux changes for track A and track C.
2. Timeout of CPD signal occurs about 35ms.
3. The Duty Cycle of RCP* will approximately equals 50% last bit time.
4. The RDD* set up time, Δt , is at least 1.33us.
